My Vision: AI x Interior Design

I'm an interior architect with a strong passion for blending design with technology. My main goal is to explore how artificial intelligence can reshape the way we imagine, create and experience interior spaces. I approach each project with curiosity and care, always aiming to create meaningful and functional designs. This portfolio reflects my journey of combining creativity with innovation as I work toward integrating AI into the future of interior design.

AI-powered projects*

Barcelona Wind Hospital

The main objective of the project is to design a site in Barcelona dedicated to the treatment of respiratory diseases, which incorporates wind turbines within its landscape and generates its energy from them. The key outcome of the project is to utilize Krea AI at every stage, learning its language, producing renders with it, and fully integrating it into the design process.

Sample Prompt

“Design a white-themed hospital interior in Barcelona with a sleek reception desk, three wind turbine columns, and expansive windows offering a mountain view. The space is bright and minimalistic, with polished surfaces and reflective elements that create a futuristic yet warm atmosphere, emphasizing clean lines and a serene environment.”

Krea AI Render

Ankara City Museum

This city museum invites visitors into a multisensory journey through the layered identity of Ankara; where memory, material, and meaning intertwine. The use of wood recalls the warmth of tradition and local craftsmanship; metal symbolizes the city's rapid modernization and industrial rise; while bold colors highlight the dynamic spirit of a capital constantly evolving. Three-dimensional spatial elements are not just displays, but storytellers, guiding the audience through Ankara's transformation from a quiet Anatolian town into the heart of a republic. As visitors move through the space, they don't just observe history, they feel its textures, trace its forms, and witness its **rebirth**.

‘BioAltitudes’: A Mountaineer and Writer's Retreat

A home designed for **Nasuh Mahruki**, his wife, and two children.

Bioaltitudes will bring together **Nasuh Mahruki's** two identities as a **writer** and **mountaineer**. The common point of the two areas will reflect the desire of **retreat** while being in touch with nature in an exaggerated way, inspired by the altitude of **Mount Everest**.

Bioaltitudes is a peaceful home that brings together the adventurous spirit of a mountaineer and the quiet focus of a writer, offering a strong connection to nature inspired by the heights of Mount Everest.

Conference Hall

A 500-seat conference and concert hall was designed with acoustics in mind to enhance sound quality for both the audience and performers. Sloped and angled surfaces prevent sound distortion, while carefully selected materials balance reflection and absorption. Natural wood supports sound diffusion, and high-density fabrics and acoustic panels reduce reverberation. Acoustic ceiling and wall panels, along with diffusers, were used to ensure clear sound throughout the hall.

Fair Stand Design

SAMPLE PROMPT

"Design a 6x6m exhibition stand for a defense company using red, black, and wood textures. Ensure a modern, bold look with sharp lines and strong materials. Include: a reception counter at the entrance, a nearby TV panel, and a fully enclosed meeting room for one-on-one discussions. Use the attached image as a structural guide. Proportions must be realistic and layout clean and impactful for a professional defense expo."

Board Design For Studios

One of the common problems in studios was that boards were too heavy and difficult to move or flip. To solve this, a new design was developed where two A3 sheets can be hung vertically, and individual panels can be easily flipped. Wheels at the base allow **easy mobility within the studio**. The board is made of metal, redwood, and metal mesh. Its color palette was inspired by the Bauhaus movement, reflecting functional and minimalist design principles.

Studios must provide a comfortable living and working environment. To understand the needs of students in these studios, a survey was sent to many design students, and based on user requests, this board was designed.
